• ceo@dreamdevelopment.net

WordPress + Laravel????

Requerimientos del cliente

- Rápido.
- Escalable.
- Social share (Open Graph friendly).
- Vistas con restricción de acceso.
- Integraciones de almacenamiento.

Area de administracion

Iniciar sesion en Facebook

Cuidado con tu Stack.

Una mala elección la pagas tú o tu cliente.

WordPress al rescate! yey!

Razones

- Curva de Aprendizaje.
- Mindsets.
- Tiempo (Deadline).
- Costos/Recursos.

Mindsets

WordPress:

- Facilidad de manejo para usuario final.
- Orientado a Contenido.

Laravel:

- Experiencia para el desarrollador.
- Entorno de herramientas de desarrollo.

WordPress

es

Consistente

y eso es

COOL!

Routing

+

WP REST API (core)

Routing:

Opciones para lograrlo:

- Corcel ("jgrossi/corsel"), tratar con la DB.
- Aprovechar funcionalidad REST API.

Bonus:

- WordPressToLaravel ("jasonherndon/wptolaravel")
- laravel-wp-api ("cyberduck/laravel-wp-api")
- Wp-Eloquent ("tareq1988/wp-eloquent")

```
Agregar datos de la base de datos en archivo config/database.php
'wordpress' => [ //Este es el nombre de su conexion
      'driver' => 'mysql',
      'host' => 'localhost',
     //Datos y credenciales de la base manejada por wordpress
      'database' => '',
      'username' => ''.
      'password' => '',
      'charset' => 'utf8',
      'collation' => 'utf8 unicode ci',
      'prefix' => 'wp ',
      'strict' => false,
      'engine' => null,
```

Corcel

```
namespace App;
use Corcel\Post as Corcel;
class Publicacion extends Corcel
    protected $connection = 'wordpress';
    1*
    Esto permitiria obtener las Publicaciones a manera Eloquent
    App\Publicacion::all();
```

Creando el modelo con `php artisan make:model Publicacion` donde extenderemos la clase Corcel

WordPress REST API

(Nuestra elección)

Primero, limpiemos.

        "large": {
          "file": "balloons-1024x683.jpg",
         "width": 1024,
          "height": 683,
          "mime-type": "image/jpeg",
          "source url": "http://api.example.com/wp-content/uploads/2015/09/balloons-1024x683.jpg"
       }.
```

Empecemos con Laravel:

```
URL de nuestro blog y su path al JSON API
    protected $url = 'http://blog.dream.dev.com/wp-json/wp/v2/';
1*
Primero pedimos el contenido, lo traemos y manejamos como JSON
*/
    protected function getContent(surl)
         $response = file get contents($url, false);
         return json decode($response);
```

Creamos una clase WpApi en la ruta app/WpApi.php para aprovechar el namespace global de laravel

```
Aca mapeamos los datos a base, iterando sobre una coleccion
creada del archivo JSON que nos da el API
    public function importPosts($page = 1)
        if ($page !=1) {
            $posts = collect($this->qetContent($this->url .
            'posts?fields=id,title,better featured image,date,modified,content&page='. $page));
            foreach ($posts as $post) {
                $this->savePost($post);
         $posts = collect($this->getContent($this->url .
          'posts?fields=id,title,better featured image,date,modified,content'));
        foreach ($posts as $post) {
            $this->savePost($post);
```

Método para guardar los publicaciones, creando una coleccion en \$posts usando el helper collect()

```
protected function savePost($data)
    $found = Post::where('id', $data->id)->first();
   if (! $found) {
        return $this->createPost($data);
    if ($found && $found->updated at->format("Y-m-d H:i:s") <
     $this->carbonDate($data->modified)->format("Y-m-d H:i:s")) {
        return $this->updatePost($found, $data);
```

Método para determinar si se debe guardar o actualizar publicaciones, comparando fechas (forma para no usar revisions en el API de WordPress)

```
return Carbon::parse($date);
                            protected function createPost($data)
                                $post = new Post();
                                $post->id = $data->id;
                                $post->featured = ($data->better featured image) ? 1 : null;
                                $post->content = $data->content->rendered;
                                $post->published at = $this->carbonDate($data->date);
                                $post->created at = $this->carbonDate($data->date);
                                $post->updated at = $this->carbonDate($data->modified);
                                $post->save();
                                return $post;
                            protected function updatePost($old, $new)
Métodos para actualizar o
                                $old->featured = ($new->better featured image) ? 1 : null;
guardar publicaciones ya
                                $old->content = $new->content->rendered;
habiendo comparando fechas
                                $old->updated at = $this->carbonDate($new->modified);
en la función anterior, usando
                                $old->save();
instancias de un modelo Post
                                return $old;
que crearemos.
```

protected function carbonDate(sdate)

Usando el comando `php artisan make:model Post -m` creamos los archivos de migración (database/migrations/) y modelo (app/Post.php). Nuestra migración para este ejemplo se debería mirar así.

```
public function up()
    Schema::create('posts', function (Blueprint $table) {
       $table->increments('id');
        $table->date('published at');
        $table->bool('featured');
        $table->text('content');
       $table->timestamps();
   });
/**
* Reverse the migrations.
  @return void
public function down()
   Schema::dropIfExists('posts');
```

Finalmente...

\$page = \$this->argument('page');

\$this->wpApi->importPosts();

usando el comando de artisan `php artisan make:command Importer` agregamos la lógica del comando en app/Console/Commands /Importer.php

Comando que agregaremos al scheduler de laravel en app/Console/Kernel.php (https://laravel.com/docs/5.4/scheduling para mas información del

scheduling en laravel)

```
class Importer extends Command
   protected $wpApi;
    protected $signature = 'import:wordpress {page? : Argumento para especifica
       numero de pagina de publicaciones}
    {--checkUpdates : Bandera para revisar actualizaciones en las publicaciones
    protected $description = 'Comando para extraer publicaciones';
   public function construct()
        parent:: construct();
        $this->wpApi= new WpApi();
    public function handle($page = 1)
```

Listo!

Gracias por su atención.
